## PART A: MATRICES

## Matrices - Introduction

$>$ Collection of $m \times n$ numbers or functions in form of $m$ horizonal lines and $n$ vertical lines is called a matrix of order m by n or $m \times n$
$>$ A $m \times n$ matrix A may be written as

$$
A=\left[\begin{array}{cccc}
a_{11} & a_{12} \cdots & a_{1 j} & \cdots \\
a_{1 n} \\
a_{21} & a_{22} \cdots & a_{2 j} & \cdots \\
\mathrm{M} & \mathrm{M} & \mathrm{M} & \mathrm{M} \\
a_{m 1} & a_{m 2} & a_{i j} & \cdots a_{m n}
\end{array}\right]=\left(a_{i j}\right)_{m \times n},
$$

Clearly $m \times n$ matrix has $m$ rows and $n$ column
The row suffix $i$ goes from 1 to $m$ while the column suffix takes values from 1 to $n$

## Matrices - Introduction

Some examples of matrices of different orders
$3 \times 3$ matrix $\left[\begin{array}{ccc}1 & 2 & 4 \\ 4 & -1 & 5 \\ 3 & 3 & 3\end{array}\right]$
$2 \times 4$ matrix $\left[\begin{array}{llll}1 & 1 & 3 & -3 \\ 0 & 0 & 3 & 2\end{array}\right]$
10 maix $\left[\begin{array}{ll}1 & -1\end{array}\right]$

## Matrices - Introduction

## TYPES OF MATRICES

1. Column matrix or vector: The number of rows may be any integer, but the number of columns is always 1

$$
\left[\begin{array}{l}
1 \\
4 \\
2
\end{array}\right] \quad\left[\begin{array}{c}
1 \\
-3
\end{array}\right] \quad\left[\begin{array}{l}
a_{11} \\
a_{21} \\
\vdots \\
a_{m 1}
\end{array}\right]
$$

## Matrices - Introduction

## TYPES OF MATRICES

2. Row matrix or vector: Any number of columns but only one row

$$
\left.\begin{array}{l}
{\left[\begin{array}{ll}
1 & 1
\end{array}\right]}
\end{array}\right] \quad\left[\begin{array}{llll}
0 & 3 & 5 & 2
\end{array}\right], ~\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13} \cdots \\
a_{1 n}
\end{array}\right] .
$$

## Matrices - Introduction

## TYPES OF MATRICES

## 3. Rectangular matrix

Contains more than one element and number of rows is not equal to the number of columns

$$
\begin{gathered}
{\left[\begin{array}{cc}
1 & 1 \\
3 & 7 \\
7 & -7 \\
7 & 6
\end{array}\right] \quad\left[\begin{array}{ccccc}
{\left[\begin{array}{cccc}
1 & 1 & 1 & 0 \\
0
\end{array}\right.} \\
2 & 0 & 3 & 3 & 0
\end{array}\right]} \\
m \neq n
\end{gathered}
$$

## Matrices - Introduction

## TYPES OF MATRICES

## 4. Square matrix

The number of rows is equal to the number of columns
(a square matrix $\mathbf{A}$ has an order of $m$ )

$$
\left[\begin{array}{ll}
1 & 1 \\
3 & 0
\end{array}\right]\left[\begin{array}{lll}
1 & 1 & 1 \\
9 & 9 & 0 \\
6 & 6 & 1
\end{array}\right]
$$

The principal or main diagonal of a square matrix is composed of all elements $\mathrm{a}_{i j}$ for which $i=j$

## Matrices - Introduction

## TYPES OF MATRICES

## 5. Diagonal matrix

A square matrix where all the elements are zero except those on the main diagonal

$$
\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 2 & 0 \\
0 & 0 & 1
\end{array}\right] \quad\left[\begin{array}{llll}
3 & 0 & 0 & 0 \\
0 & 3 & 0 & 0 \\
0 & 0 & 5 & 0 \\
0 & 0 & 0 & 9
\end{array}\right]
$$

$$
\begin{aligned}
& \text { i.e., } \mathrm{a}_{i j}=0 \text { for all } i \neq j \\
& \mathrm{a}_{i j} \neq 0 \text { for some or all } i=j
\end{aligned}
$$

## Matrices - Introduction

## TYPES OF MATRICES

6. Unit or Identity matrix - I

A diagonal matrix with ones on the main diagonal

$$
\left.\begin{array}{l}
{\left[\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]} \\
\text { i.e. } \mathrm{a}_{i j}=0 \text { for all } i \neq j \\
\mathrm{a}_{i j}=1 \text { for some or all } i=j \\
0
\end{array} 1\right]\left[\begin{array}{ll}
1 & 0 \\
0 & a_{i j}
\end{array}\right]
$$

## Matrices - Introduction

## TYPES OF MATRICES

## 7. Null (zero) matrix - 0

All elements in the matrix are zero

$$
\begin{aligned}
& {\left[\begin{array}{l}
0 \\
0 \\
0
\end{array}\right] \quad\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]} \\
& a_{i j}=0 \quad \text { For all } i, j
\end{aligned}
$$

## Matrices - Introduction

## TYPES OF MATRICES

## 8. Triangular matrix

A square matrix whose elements above or below the main diagonal are all zero

$$
\left[\begin{array}{lll}
1 & 0 & 0 \\
2 & 1 & 0 \\
5 & 2 & 3
\end{array}\right]\left[\begin{array}{lll}
1 & 0 & 0 \\
2 & 1 & 0 \\
5 & 2 & 3
\end{array}\right] \quad\left[\begin{array}{lll}
1 & 8 & 9 \\
0 & 1 & 6 \\
0 & 0 & 3
\end{array}\right]
$$

## Matrices - Introduction

## TYPES OF MATRICES

## 8a. Upper triangular matrix

A square matrix whose elements below the main diagonal are all zero

$$
\left[\begin{array}{ccc}
a_{i j} & a_{i j} & a_{i j} \\
0 & a_{i j} & a_{i j} \\
0 & 0 & a_{i j}
\end{array}\right]\left[\begin{array}{lll}
1 & 8 & 7 \\
0 & 1 & 8 \\
0 & 0 & 3
\end{array}\right] \quad\left[\begin{array}{cccc}
1 & 7 & 4 & 4 \\
0 & 1 & 7 & 4 \\
0 & 0 & 7 & 8 \\
0 & 0 & 0 & 3
\end{array}\right]
$$

i.e. $\mathrm{a}_{i j}=0$ for all $i>j$

## Matrices - Introduction

## TYPES OF MATRICES

## 8b. Lower triangular matrix

A square matrix whose elements above the main diagonal are all zero

$$
\left[\begin{array}{ccc}
a_{i j} & 0 & 0 \\
a_{i j} & a_{i j} & 0 \\
a_{i j} & a_{i j} & a_{i j}
\end{array}\right] \quad\left[\begin{array}{ccc}
1 & 0 & 0 \\
2 & 1 & 0 \\
5 & 2 & 3
\end{array}\right]
$$

i.e. $\mathrm{a}_{i j}=0$ for all $i<j$

## Matrices - Introduction

## TYPES OF MATRICES

9. Scalar matrix

A diagonal matrix whose main diagonal elements are equal to the same scalar

A scalar is defined as a single number or constant

$$
\left[\begin{array}{ccc}
a_{i j} & 0 & 0 \\
0 & a_{i j} & 0 \\
0 & 0 & a_{i j}
\end{array}\right]\left[\begin{array}{ccc}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
6 & 0 & 0 & 0 \\
0 & 6 & 0 & 0 \\
0 & 0 & 6 & 0 \\
0 & 0 & 0 & 6
\end{array}\right]
$$

$\mathrm{a}_{i j}=\mathrm{a}$ for all $i=j$

## Matrices - Operations

## EQUALITY OF MATRICES

Two matrices are said to be equal only when all corresponding elements are equal

Therefore their size or dimensions are equal as well

$$
\mathbf{A}=\left[\begin{array}{lll}
1 & 0 & 0 \\
2 & 1 & 0 \\
5 & 2 & 3
\end{array}\right] \quad \mathbf{B}=\left[\begin{array}{lll}
1 & 0 & 0 \\
2 & 1 & 0 \\
5 & 2 & 3
\end{array}\right] \quad \mathbf{A}=\mathbf{B}
$$

## Matrices - Operations

Some properties of equality:
-If $\mathbf{A}=\mathbf{B}$, then $\mathbf{B}=\mathbf{A}$
$\cdot$ If $\mathbf{A}=\mathbf{B}$, and $\mathbf{B}=\mathbf{C}$, then $\mathbf{A}=\mathbf{C}$ for all $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$

$$
\mathbf{A}=\left[\begin{array}{lll}
1 & 0 & 0 \\
2 & 1 & 0 \\
5 & 2 & 3
\end{array}\right] \quad \mathbf{B}=\left[\begin{array}{lll}
b_{11} & b_{12} & b_{13} \\
b_{21} & b_{22} & b_{23} \\
b_{31} & b_{32} & b_{33}
\end{array}\right]
$$

If $\mathbf{A}=\mathbf{B}$ then $\quad a_{i j}=b_{i j}$

## Matrices - Operations

## ADDITION AND SUBTRACTION OF MATRICES

The sum or difference of two matrices, $\mathbf{A}$ and $\mathbf{B}$ of the same size yields a matrix $\mathbf{C}$ of the same size

$$
c_{i j}=a_{i j}+b_{i j}
$$

Matrices of different sizes cannot be added or subtracted

## Matrices - Operations

Commutative Law:
$\mathbf{A}+\mathbf{B}=\mathbf{B}+\mathbf{A}$
Associative Law:

$$
\mathbf{A}+(\mathbf{B}+\mathbf{C})=(\mathbf{A}+\mathbf{B})+\mathbf{C}=\mathbf{A}+\mathbf{B}+\mathbf{C}
$$

$$
\left[\begin{array}{ccc}
7 & 3 & -1 \\
2 & -5 & 6
\end{array}\right]+\left[\begin{array}{ccc}
1 & 5 & 6 \\
-4 & -2 & 3
\end{array}\right]=\left[\begin{array}{ccc}
8 & 8 & 5 \\
-2 & -7 & 9
\end{array}\right]
$$

A
2x3

B
2x3

C
$2 \times 3$

## Matrices - Operations

$\mathbf{A}+\mathbf{0}=\mathbf{0}+\mathbf{A}=\mathbf{A}$
$\mathbf{A}+(-\mathbf{A})=\mathbf{0}$ (where $-\mathbf{A}$ is the matrix composed of $-\mathrm{a}_{i j}$ as elements)

$$
\left[\begin{array}{lll}
6 & 4 & 2 \\
3 & 2 & 7
\end{array}\right]-\left[\begin{array}{lll}
1 & 2 & 0 \\
1 & 0 & 8
\end{array}\right]=\left[\begin{array}{ccc}
5 & 2 & 2 \\
2 & 2 & -1
\end{array}\right]
$$

## Matrices - Operations

## SCALAR MULTIPLICATION OF MATRICES

Matrices can be multiplied by a scalar (constant or single element)

Let k be a scalar quantity; then

Ex. If $\mathrm{k}=4$ and

$$
\begin{gathered}
\mathbf{k} \mathbf{A}=\mathbf{A k} \\
A=\left[\begin{array}{cc}
3 & -1 \\
2 & 1 \\
2 & -3 \\
4 & 1
\end{array}\right]
\end{gathered}
$$

## Matrices - Operations

$$
4 \times\left[\begin{array}{cc}
3 & -1 \\
2 & 1 \\
2 & -3 \\
4 & 1
\end{array}\right]=\left[\begin{array}{cc}
3 & -1 \\
2 & 1 \\
2 & -3 \\
4 & 1
\end{array}\right] \times 4=\left[\begin{array}{cc}
12 & -4 \\
8 & 4 \\
8 & -12 \\
16 & 4
\end{array}\right]
$$

Properties:
$\cdot \mathrm{k}(\mathbf{A}+\mathbf{B})=\mathrm{k} \mathbf{A}+\mathrm{k} \mathbf{B}$

- $(\mathrm{k}+\mathrm{g}) \mathbf{A}=\mathrm{k} \mathbf{A}+\mathrm{g} \mathbf{A}$
- $\mathrm{k}(\mathbf{A B})=(\mathrm{k} \mathbf{A}) \mathbf{B}=\mathbf{A}(\mathrm{k}) \mathbf{B}$
- $\mathrm{k}(\mathrm{gA})=(\mathrm{kg}) \mathbf{A}$

## Matrices - Operations

## MULTIPLICATION OF MATRICES

The product of two matrices is another matrix
Two matrices $\mathbf{A}$ and $\mathbf{B}$ must be conformable for multiplication to be possible
i.e. the number of columns of $\mathbf{A}$ must equal the number of rows of B

Example.

$$
\begin{gathered}
\text { A } \quad \text { } \quad=\quad \mathbf{C} \\
(1 \times 3) \quad(3 \times 1) \quad(1 \times 1)
\end{gathered}
$$

## Matrices - Operations

B $\mathbf{x} \quad \mathbf{A}=$ Not possible!
(2x1) (4x2)
$\mathbf{A} \quad \mathbf{x} \quad=$ Not possible!
(6x2) (6x3)

Example
A $\mathrm{x} \quad \mathbf{B}=\mathbf{C}$
$(2 \mathrm{x} 3) \quad(3 \times 2) \quad(2 \times 2)$

## Matrices - Operations

$$
\begin{aligned}
& {\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23}
\end{array}\right]\left[\begin{array}{ll}
b_{11} & b_{12} \\
b_{21} & b_{22} \\
b_{31} & b_{32}
\end{array}\right]=\left[\begin{array}{ll}
c_{11} & c_{12} \\
c_{21} & c_{22}
\end{array}\right]} \\
& \left(a_{11} \times b_{11}\right)+\left(a_{12} \times b_{21}\right)+\left(a_{13} \times b_{31}\right)=c_{11} \\
& \left(a_{11} \times b_{12}\right)+\left(a_{12} \times b_{22}\right)+\left(a_{13} \times b_{32}\right)=c_{12} \\
& \left(a_{21} \times b_{11}\right)+\left(a_{22} \times b_{21}\right)+\left(a_{23} \times b_{31}\right)=c_{21} \\
& \left(a_{21} \times b_{12}\right)+\left(a_{22} \times b_{22}\right)+\left(a_{23} \times b_{32}\right)=c_{22}
\end{aligned}
$$

Successive multiplication of row $i$ of $\mathbf{A}$ with column $j$ of B - row by column multiplication

## Matrices - Operations

$$
\begin{aligned}
{\left[\begin{array}{lll}
1 & 2 & 3 \\
4 & 2 & 7
\end{array}\right]\left[\begin{array}{ll}
4 & 8 \\
6 & 2 \\
5 & 3
\end{array}\right] } & =\left[\begin{array}{ll}
(1 \times 4)+(2 \times 6)+(3 \times 5) & (1 \times 8)+(2 \times 2)+(3 \times 3) \\
(4 \times 4)+(2 \times 6)+(7 \times 5) & (4 \times 8)+(2 \times 2)+(7 \times 3)
\end{array}\right] \\
& =\left[\begin{array}{ll}
31 & 21 \\
63 & 57
\end{array}\right]
\end{aligned}
$$

Remember also:

$$
\mathbf{I A}=\mathbf{A}
$$

$$
\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]\left[\begin{array}{ll}
31 & 21 \\
63 & 57
\end{array}\right]=\left[\begin{array}{ll}
31 & 21 \\
63 & 57
\end{array}\right]
$$

## Matrices - Operations

Assuming that matrices $\mathbf{A}, \mathbf{B}$ and $\mathbf{C}$ are conformable for the operations indicated, the following are true:

1. $\mathbf{A I}=\mathbf{I A}=\mathbf{A}$
2. $\mathbf{A}(\mathbf{B C})=(\mathbf{A B}) \mathbf{C}=\mathbf{A B C}-$ (associative law)
3. $\mathbf{A}(\mathbf{B}+\mathbf{C})=\mathbf{A B}+\mathbf{A C}$ - (first distributive law)
4. $(\mathbf{A}+\mathbf{B}) \mathbf{C}=\mathbf{A C}+\mathbf{B C}-$ (second distributive law)

## Caution!

1. $\mathbf{A B}$ not generally equal to $\mathbf{B A}, \mathbf{B A}$ may not be conformable
2. If $\mathbf{A B}=\mathbf{0}$, neither $\mathbf{A}$ nor $\mathbf{B}$ necessarily $=\mathbf{0}$
3. If $\mathbf{A B}=\mathbf{A C}, \mathbf{B}$ not necessarily $=\mathbf{C}$

## Matrices - Operations

$\mathbf{A B}$ not generally equal to $\mathbf{B A}, \mathbf{B A}$ may not be conformable

$$
\begin{aligned}
& T=\left[\begin{array}{ll}
1 & 2 \\
5 & 0
\end{array}\right] \\
& S=\left[\begin{array}{ll}
3 & 4 \\
0 & 2
\end{array}\right] \\
& T S=\left[\begin{array}{ll}
1 & 2 \\
5 & 0
\end{array}\right]\left[\begin{array}{ll}
3 & 4 \\
0 & 2
\end{array}\right]=\left[\begin{array}{cc}
3 & 8 \\
15 & 20
\end{array}\right] \\
& S T=\left[\begin{array}{ll}
3 & 4 \\
0 & 2
\end{array}\right]\left[\begin{array}{ll}
1 & 2 \\
5 & 0
\end{array}\right]=\left[\begin{array}{cc}
23 & 6 \\
10 & 0
\end{array}\right]
\end{aligned}
$$

## Matrices - Operations

If $\mathbf{A B}=\mathbf{0}$, neither $\mathbf{A}$ nor $\mathbf{B}$ necessarily $=\mathbf{0}$

$$
\left[\begin{array}{ll}
1 & 1 \\
0 & 0
\end{array}\right]\left[\begin{array}{cc}
2 & 3 \\
-2 & -3
\end{array}\right]=\left[\begin{array}{ll}
0 & 0 \\
0 & 0
\end{array}\right]
$$

## Matrices - Operations

## TRANSPOSE OF A MATRIX

$$
A=\left[\begin{array}{ccc}
2 & 4 & 7 \\
5 & 3 & 1
\end{array}\right]_{2 \times 3}
$$

Then transpose of A , denoted $\mathrm{A}^{\mathrm{T}}$ is:

$$
\begin{aligned}
& A^{T}=\left[\begin{array}{ll}
2 & 5 \\
4 & 3 \\
7 & 1
\end{array}\right]_{3 \times 2} \\
& a_{i j}=a_{j i}^{T} \quad \text { For all } i \text { and } j
\end{aligned}
$$

## Matrices - Operations

Properties of transposed matrices:

1. $(\mathbf{A}+\mathbf{B})^{\mathrm{T}}=\mathbf{A}^{\mathrm{T}}+\mathbf{B}^{\mathrm{T}}$
2. $(\mathbf{A B})^{\mathrm{T}}=\mathbf{B}^{\mathrm{T}} \mathbf{A}^{\mathrm{T}}$
3. $(\mathrm{k} \mathbf{A})^{\mathrm{T}}=\mathrm{k} \mathbf{A}^{\mathrm{T}}$
4. $\left(\mathbf{A}^{\mathrm{T}}\right)^{\mathrm{T}}=\mathbf{A}$

Matrices - Operations

1. $(\mathbf{A}+\mathbf{B})^{\mathrm{T}}=\mathbf{A}^{\mathrm{T}}+\mathbf{B}^{\mathrm{T}}$

$$
\begin{aligned}
& {\left[\begin{array}{ccc}
7 & 3 & -1 \\
2 & -5 & 6
\end{array}\right]+\left[\begin{array}{ccc}
1 & 5 & 6 \\
-4 & -2 & 3
\end{array}\right]=\left[\begin{array}{ccc}
8 & 8 & 5 \\
-2 & -7 & 9
\end{array}\right] \rightarrow\left[\begin{array}{cc}
8 & -2 \\
8 & -7 \\
5 & 9
\end{array}\right]} \\
& {\left[\begin{array}{cc}
7 & 2 \\
3 & -5 \\
-1 & 6
\end{array}\right]+\left[\begin{array}{cc}
1 & -4 \\
5 & -2 \\
6 & 3
\end{array}\right]=\left[\begin{array}{cc}
8 & -2 \\
8 & -7 \\
5 & 9
\end{array}\right]}
\end{aligned}
$$

Matrices - Operations

$$
(\mathbf{A B})^{\mathrm{T}}=\mathbf{B}^{\mathrm{T}} \mathbf{A}^{\mathrm{T}}
$$

$$
\begin{aligned}
& {\left[\begin{array}{lll}
1 & 1 & 0 \\
0 & 2 & 3
\end{array}\right]\left[\begin{array}{l}
1 \\
1 \\
2
\end{array}\right]=\left[\begin{array}{l}
2 \\
8
\end{array}\right] \Rightarrow\left[\begin{array}{ll}
2 & 8
\end{array}\right]} \\
& {\left[\begin{array}{lll}
1 & 1 & 2
\end{array}\right]\left[\begin{array}{ll}
1 & 0 \\
1 & 2 \\
0 & 3
\end{array}\right]=\left[\begin{array}{ll}
2 & 8
\end{array}\right]}
\end{aligned}
$$

## Matrices - Operations

## SYMMETRIC MATRICES

A Square matrix is symmetric if it is equal to its transpose:

$$
\begin{gathered}
\mathbf{A}=\mathbf{A}^{\mathrm{T}} \\
A=\left[\begin{array}{ll}
a & b \\
b & d
\end{array}\right] \\
A^{T}=\left[\begin{array}{ll}
a & b \\
b & d
\end{array}\right]
\end{gathered}
$$

## Matrices - Operations

When the original matrix is square, transposition does not affect the elements of the main diagonal

$$
\begin{aligned}
& A=\left[\begin{array}{ll}
a & b \\
c & d
\end{array}\right] \\
& A^{T}=\left[\begin{array}{ll}
a & c \\
b & d
\end{array}\right]
\end{aligned}
$$

The identity matrix, $\mathbf{I}$, a diagonal matrix $\mathbf{D}$, and a scalar matrix, $\mathbf{K}$, are equal to their transpose since the diagonal is unaffected.

## Matrices - Operations

## INVERSE OF A MATRIX

Consider a scalar k. The inverse is the reciprocal or division of 1 by the scalar.

Example:
$\mathrm{k}=7 \quad$ the inverse of k or $\mathrm{k}^{-1}=1 / \mathrm{k}=1 / 7$
Division of matrices is not defined since there may be $\mathbf{A B}=\mathbf{A C}$ while $\mathbf{B} \neq \mathbf{C}$

Instead matrix inversion is used.
The inverse of a square matrix, $\mathbf{A}$, if it exists, is the unique matrix $\mathbf{A}^{-1}$ where:

$$
\mathbf{A A}^{-1}=\mathbf{A}^{-1} \mathbf{A}=\mathbf{I}
$$

## Matrices - Operations

Example:

$$
\begin{aligned}
& A=\left[\begin{array}{ll}
3 & 1 \\
2 & 1
\end{array}\right] \\
& A^{-1}=\left[\begin{array}{cc}
1 & -1 \\
-2 & 3
\end{array}\right]
\end{aligned}
$$

Because:

$$
\begin{aligned}
& {\left[\begin{array}{cc}
1 & -1 \\
-2 & 3
\end{array}\right]\left[\begin{array}{ll}
3 & 1 \\
2 & 1
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]} \\
& {\left[\begin{array}{ll}
3 & 1 \\
2 & 1
\end{array}\right]\left[\begin{array}{cc}
1 & -1 \\
-2 & 3
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]}
\end{aligned}
$$

## Matrices - Operations

Properties of the inverse:

$$
\begin{aligned}
& (A B)^{-1}=B^{-1} A^{-1} \\
& \left(A^{-1}\right)^{-1}=A \\
& \left(A^{T}\right)^{-1}=\left(A^{-1}\right)^{T} \\
& (k A)^{-1}=\frac{1}{k} A^{-1}
\end{aligned}
$$

A square matrix that has an inverse is called a nonsingular matrix A matrix that does not have an inverse is called a singular matrix Square matrices have inverses except when the determinant is zero When the determinant of a matrix is zero the matrix is singular

## Matrices - Operations

## DETERMINANT OF A MATRIX

To compute the inverse of a matrix, the determinant is required
Each square matrix $\mathbf{A}$ has a unit scalar value called the determinant of $\mathbf{A}$, denoted by $\operatorname{det} \mathbf{A}$ or $|\mathbf{A}|$

If $\quad A=\left[\begin{array}{ll}1 & 2 \\ 6 & 5\end{array}\right]$
then $\quad|A|=\left|\begin{array}{ll}1 & 2 \\ 6 & 5\end{array}\right|$

## Matrices - Operations

If $\mathbf{A}=[\mathbf{A}]$ is a single element ( 1 x 1 ), then the determinant is defined as the value of the element

Then $|\mathbf{A}|=\operatorname{det} \mathbf{A}=\mathrm{a}_{11}$
If $\mathbf{A}$ is ( $\mathrm{n} \times \mathrm{n}$ ), its determinant may be defined in terms of order ( $\mathrm{n}-1$ ) or less.

## Matrices - Operations

## MINORS

If $\mathbf{A}$ is an nx n matrix and one row and one column are deleted, the resulting matrix is an $(n-1) x(n-1)$ submatrix of $\mathbf{A}$.

The determinant of such a submatrix is called a minor of $\mathbf{A}$ and is designated by $\mathrm{m}_{i j}$, where $i$ and $j$ correspond to the deleted row and column, respectively.
$\mathrm{m}_{i j}$ is the minor of the element $\mathrm{a}_{i j}$ in $\mathbf{A}$.

## Matrices - Operations

$$
\text { eg. } A=\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{array}\right]
$$

Each element in $\mathbf{A}$ has a minor
Delete first row and column from $\mathbf{A}$.
The determinant of the remaining $2 \times 2$ submatrix is the minor of $\mathbf{a}_{11}$

$$
m_{11}=\left|\begin{array}{ll}
a_{22} & a_{23} \\
a_{32} & a_{33}
\end{array}\right|
$$

## Matrices - Operations

Therefore the minor of $\mathrm{a}_{12}$ is:

$$
m_{12}=\left|\begin{array}{ll}
a_{21} & a_{23} \\
a_{31} & a_{33}
\end{array}\right|
$$

And the minor for $\mathrm{a}_{13}$ is:

$$
m_{13}=\left|\begin{array}{ll}
a_{21} & a_{22} \\
a_{31} & a_{32}
\end{array}\right|
$$

## Matrices - Operations

## COFACTORS

The cofactor $\mathrm{C}_{i j}$ of an element $\mathrm{a}_{i j}$ is defined as:

$$
C_{i j}=(-1)^{i+j} m_{i j}
$$

When the sum of a row number $i$ and column $j$ is even, $\mathrm{c}_{i j}=\mathrm{m}_{i j}$ and when $i+j$ is odd, $\mathrm{c}_{i j}=-\mathrm{m}_{i j}$

$$
\begin{aligned}
& c_{11}(i=1, j=1)=(-1)^{1+1} m_{11}=+m_{11} \\
& c_{12}(i=1, j=2)=(-1)^{1+2} m_{12}=-m_{12} \\
& c_{13}(i=1, j=3)=(-1)^{1+3} m_{13}=+m_{13}
\end{aligned}
$$

## Matrices - Operations

## DETERMINANTS CONTINUED

The determinant of an nx n matrix $\mathbf{A}$ can now be defined as

$$
|A|=\operatorname{det} A=a_{11} c_{11}+a_{12} c_{12}+\ldots+a_{1 n} c_{1 n}
$$

The determinant of $\mathbf{A}$ is therefore the sum of the products of the elements of the first row of $\mathbf{A}$ and their corresponding cofactors. (It is possible to define $|\mathbf{A}|$ in terms of any other row or column but for simplicity, the first row only is used)

## Matrices - Operations

Therefore the $2 \times 2$ matrix :

$$
A=\left[\begin{array}{ll}
a_{11} & a_{12} \\
a_{21} & a_{22}
\end{array}\right]
$$

Has cofactors :

$$
c_{11}=m_{11}=\left|a_{22}\right|=a_{22}
$$

And:

$$
c_{12}=-m_{12}=-\left|a_{21}\right|=-a_{21}
$$

And the determinant of $\mathbf{A}$ is:

$$
|A|=a_{11} c_{11}+a_{12} c_{12}=a_{11} a_{22}-a_{12} a_{21}
$$

## Matrices - Operations

Example 1:

$$
\begin{gathered}
A=\left[\begin{array}{ll}
3 & 1 \\
1 & 2
\end{array}\right] \\
|A|=(3)(2)-(1)(1)=5
\end{gathered}
$$

## Matrices - Operations

For a $3 \times 3$ matrix:

$$
A=\left[\begin{array}{lll}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{array}\right]
$$

The cofactors of the first row are:

$$
\begin{aligned}
& c_{11}=\left|\begin{array}{ll}
a_{22} & a_{23} \\
a_{32} & a_{33}
\end{array}\right|=a_{22} a_{33}-a_{23} a_{32} \\
& c_{12}=-\left|\begin{array}{ll}
a_{21} & a_{23} \\
a_{31} & a_{33}
\end{array}\right|=-\left(a_{21} a_{33}-a_{23} a_{31}\right) \\
& c_{13}=\left|\begin{array}{ll}
a_{21} & a_{22} \\
a_{31} & a_{32}
\end{array}\right|=a_{21} a_{32}-a_{22} a_{31}
\end{aligned}
$$

## Matrices - Operations

The determinant of a matrix A is:

$$
|A|=a_{11} c_{11}+a_{12} c_{12}=a_{11} a_{22}-a_{12} a_{21}
$$

Which by substituting for the cofactors in this case is:

$$
|A|=a_{11}\left(a_{22} a_{33}-a_{23} a_{32}\right)-a_{12}\left(a_{21} a_{33}-a_{23} a_{31}\right)+a_{13}\left(a_{21} a_{32}-a_{22} a_{31}\right)
$$

## Matrices - Operations

Example 2:

$$
A=\left[\begin{array}{ccc}
1 & 0 & 1 \\
0 & 2 & 3 \\
-1 & 0 & 1
\end{array}\right]
$$

$$
|A|=a_{11}\left(a_{22} a_{33}-a_{23} a_{32}\right)-a_{12}\left(a_{21} a_{33}-a_{23} a_{31}\right)+a_{13}\left(a_{21} a_{32}-a_{22} a_{31}\right)
$$

$$
|A|=(1)(2-0)-(0)(0+3)+(1)(0+2)=4
$$

## Matrices - Operations

## ADJOINT MATRICES

A cofactor matrix $\mathbf{C}$ of a matrix $\mathbf{A}$ is the square matrix of the same order as $\mathbf{A}$ in which each element $\mathrm{a}_{i j}$ is replaced by its cofactor $\mathrm{c}_{i j}$.

Example:

$$
\text { If } \quad A=\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right]
$$

The cofactor C of A is $\quad C=\left[\begin{array}{cc}4 & 3 \\ -2 & 1\end{array}\right]$

## Matrices - Operations

The adjoint matrix of $\mathbf{A}$, denoted by $\operatorname{adj} \mathbf{A}$, is the transpose of its cofactor matrix

$$
\operatorname{adj} A=C^{T}
$$

It can be shown that:

$$
\mathbf{A}(\operatorname{adj} \mathbf{A})=(\operatorname{adj} \mathbf{A}) \mathbf{A}=|\mathbf{A}| \mathbf{I}
$$

Example:

$$
\begin{aligned}
& A=\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right] \\
& |A|=(1)(4)-(2)(-3)=10 \\
& \operatorname{adj} A=C^{T}=\left[\begin{array}{cc}
4 & -2 \\
3 & 1
\end{array}\right]
\end{aligned}
$$

## Matrices - Operations

$$
\begin{aligned}
& A(\operatorname{adj} A)=\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right]\left[\begin{array}{cc}
4 & -2 \\
3 & 1
\end{array}\right]=\left[\begin{array}{cc}
10 & 0 \\
0 & 10
\end{array}\right]=10 I \\
& (\operatorname{adj} A) A=\left[\begin{array}{cc}
4 & -2 \\
3 & 1
\end{array}\right]\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right]=\left[\begin{array}{cc}
10 & 0 \\
0 & 10
\end{array}\right]=10 I
\end{aligned}
$$

## Matrices - Operations

## USING THE ADJOINT MATRIX IN MATRIX INVERSION

Since

$$
\mathbf{A A}^{-1}=\mathbf{A}^{-1} \mathbf{A}=\mathbf{I}
$$

and

$$
\mathbf{A}(\operatorname{adj} \mathbf{A})=(\operatorname{adj} \mathbf{A}) \mathbf{A}=|\mathbf{A}| \mathbf{I}
$$

then

$$
A^{-1}=\frac{\operatorname{adj} A}{|A|}
$$

## Matrices - Operations

Example

$$
\begin{gathered}
\mathbf{A}=\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right] \\
A^{-1}=\frac{1}{10}\left[\begin{array}{cc}
4 & -2 \\
3 & 1
\end{array}\right]=\left[\begin{array}{cc}
0.4 & -0.2 \\
0.3 & 0.1
\end{array}\right]
\end{gathered}
$$

To check

$$
\mathbf{A} \mathbf{A}^{-1}=\mathbf{A}^{-1} \mathbf{A}=\mathbf{I}
$$

$$
\begin{aligned}
& A A^{-1}=\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right]\left[\begin{array}{cc}
0.4 & -0.2 \\
0.3 & 0.1
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]=I \\
& A^{-1} A=\left[\begin{array}{cc}
0.4 & -0.2 \\
0.3 & 0.1
\end{array}\right]\left[\begin{array}{cc}
1 & 2 \\
-3 & 4
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]=I
\end{aligned}
$$

## Matrices - Operations

Example 2

$$
A=\left[\begin{array}{ccc}
3 & -1 & 1 \\
2 & 1 & 0 \\
1 & 2 & -1
\end{array}\right]
$$

The determinant of $\mathbf{A}$ is

$$
|\mathbf{A}|=(3)(-1-0)-(-1)(-2-0)+(1)(4-1)=-2
$$

The elements of the cofactor matrix are

$$
\begin{array}{lll}
c_{11}=+(-1), & c_{12}=-(-2), & c_{13}=+(3), \\
c_{21}=-(-1), & c_{22}=+(-4), & c_{23}=-(7), \\
c_{31}=+(-1), & c_{32}=-(-2), & c_{33}=+(5),
\end{array}
$$

## Matrices - Operations

The cofactor matrix is therefore

$$
C=\left[\begin{array}{ccc}
-1 & 2 & 3 \\
1 & -4 & -7 \\
-1 & 2 & 5
\end{array}\right]
$$

so

$$
\operatorname{adj} A=C^{T}=\left[\begin{array}{ccc}
-1 & 1 & -1 \\
2 & -4 & 2 \\
3 & -7 & 5
\end{array}\right]
$$

$$
\begin{aligned}
& \text { and } \\
& \qquad A^{-1}=\frac{a d j A}{|A|}=\frac{1}{-2}\left[\begin{array}{ccc}
-1 & 1 & -1 \\
2 & -4 & 2 \\
3 & -7 & 5
\end{array}\right]=\left[\begin{array}{ccc}
0.5 & -0.5 & 0.5 \\
-1.0 & 2.0 & -1.0 \\
-1.5 & 3.5 & -2.5
\end{array}\right]
\end{aligned}
$$

## Matrices - Operations

The result can be checked using

$$
\mathbf{A A}^{-1}=\mathbf{A}^{-1} \mathbf{A}=\mathbf{I}
$$

The determinant of a matrix must not be zero for the inverse to exist as there will not be a solution

Nonsingular matrices have non-zero determinants
Singular matrices have zero determinants

## Matrix Inversion

Simple $2 \times 2$ case

## Simple $2 \times 2$ case

Let

$$
A=\left[\begin{array}{ll}
a & b \\
c & d
\end{array}\right] \quad \text { and } \quad A^{-1}=\left[\begin{array}{ll}
w & x \\
y & z
\end{array}\right]
$$

Since it is known that

$$
\mathbf{A ~ A}^{-1}=\mathbf{I}
$$

then

$$
\left[\begin{array}{ll}
a & b \\
c & d
\end{array}\right]\left[\begin{array}{ll}
w & x \\
y & z
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]
$$

## Simple $2 \times 2$ case

Multiplying gives

$$
\begin{aligned}
& a w+b y=1 \\
& a x+b z=0 \\
& c w+d y=0 \\
& c x+d z=1
\end{aligned}
$$

It can simply be shown that

$$
|A|=a d-b c
$$

## Simple $2 \times 2$ case

thus

$$
\begin{aligned}
& y=\frac{1-a w}{b} \\
& y=\frac{-c w}{d} \\
& \frac{1-a w}{b}=\frac{-c w}{d} \\
& w=\frac{d}{d a-b c}=\frac{d}{|A|}
\end{aligned}
$$

Simple $2 \times 2$ case

$$
\begin{aligned}
& z=\frac{-a x}{b} \\
& z=\frac{1-c x}{d} \\
& \frac{-a x}{b}=\frac{1-c x}{d} \\
& x=\frac{b}{-d a+b c}=-\frac{b}{|A|}
\end{aligned}
$$

## Simple $2 \times 2$ case

$$
\begin{aligned}
& w=\frac{1-b y}{a} \\
& w=\frac{-d y}{c} \\
& \frac{1-b y}{a}=\frac{-d y}{c} \\
& y=\frac{c}{-a d+c b}=-\frac{c}{|A|}
\end{aligned}
$$

Simple $2 \times 2$ case

$$
\begin{aligned}
& x=\frac{-b z}{a} \\
& x=\frac{1-d z}{c} \\
& \frac{-b z}{a}=\frac{1-d z}{c} \\
& z=\frac{a}{a d-b c}=\frac{a}{|A|}
\end{aligned}
$$

## Simple $2 \times 2$ case

So that for a $2 \times 2$ matrix the inverse can be constructed in a simple fashion as

$$
A^{-1}=\left[\begin{array}{cc}
w & x \\
y & z
\end{array}\right]=\left[\begin{array}{cc}
\frac{d}{|A|} & \frac{b}{|A|} \\
\frac{-c}{|A|} & \frac{a}{|A|}
\end{array}\right]=\frac{1}{|A|}\left[\begin{array}{cc}
d & -b \\
-c & a
\end{array}\right]
$$

-Exchange elements of main diagonal

- Change sign in elements off main diagonal
-Divide resulting matrix by the determinant

## Simple $2 \times 2$ case

Example

$$
\begin{aligned}
& A=\left[\begin{array}{ll}
2 & 3 \\
4 & 1
\end{array}\right] \\
& A^{-1}=-\frac{1}{10}\left[\begin{array}{cc}
1 & -3 \\
-4 & 2
\end{array}\right]=\left[\begin{array}{cc}
-0.1 & 0.3 \\
0.4 & -0.2
\end{array}\right]
\end{aligned}
$$

Check inverse

$$
\begin{aligned}
& \mathbf{A}^{-1} \mathbf{A}=\mathbf{I} \\
& -\frac{1}{10}\left[\begin{array}{cc}
1 & -3 \\
-4 & 2
\end{array}\right]\left[\begin{array}{ll}
2 & 3 \\
4 & 1
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]=I
\end{aligned}
$$

# Matrices and Linear Equations 

## Linear Equations

Linear equations are common and important for survey problems

Matrices can be used to express these linear equations and aid in the computation of unknown values

Example
$n$ equations in $n$ unknowns, the $\mathrm{a}_{i j}$ are numerical coefficients, the $\mathrm{b}_{i}$ are constants and the $\mathrm{x}_{j}$ are unknowns

$$
\begin{aligned}
& a_{11} x_{1}+a_{12} x_{2}+\cdots+a_{1 n} x_{n}=b_{1} \\
& a_{21} x_{1}+a_{22} x_{2}+\cdots+a_{2 n} x_{n}=b_{2} \\
& \vdots \\
& a_{n 1} x_{1}+a_{n 2} x_{2}+\cdots+a_{n n} x_{n}=b_{n}
\end{aligned}
$$

## Linear Equations

The equations may be expressed in the form

$$
\mathbf{A X}=\mathbf{B}
$$

where

$$
\begin{array}{r}
A=\left[\begin{array}{lll}
a_{11} & a_{12} \cdots & a_{1 n} \\
a_{21} & a_{22} \cdots & a_{2 n} \\
\vdots & \vdots & \vdots \\
a_{n 1} & a_{n 1} \cdots & a_{n n}
\end{array}\right], X=\left[\begin{array}{l}
x_{1} \\
x_{2} \\
\vdots \\
x_{n}
\end{array}\right], \text { and } \quad B=\left[\begin{array}{l}
b_{1} \\
b_{2} \\
\vdots \\
b_{n}
\end{array}\right] \\
\mathrm{n} \times \mathrm{n}
\end{array}
$$

Number of unknowns $=$ number of equations $=n$

## Linear Equations

If the determinant is nonzero, the equation can be solved to produce n numerical values for x that satisfy all the simultaneous equations

To solve, premultiply both sides of the equation by $\mathbf{A}^{-1}$ which exists because $|\mathbf{A}| \neq \mathbf{0}$

$$
\mathbf{A}^{-1} \mathbf{A X}=\mathbf{A}^{-1} \mathbf{B}
$$

Now since

$$
\mathbf{A}^{-1} \mathbf{A}=\mathbf{I}
$$

We get

$$
\mathbf{X}=\mathbf{A}^{-1} \mathbf{B}
$$

So if the inverse of the coefficient matrix is found, the unknowns, $\mathbf{X}$ would be determined

## Linear Equations

Example

$$
\begin{aligned}
& 3 x_{1}-x_{2}+x_{3}=2 \\
& 2 x_{1}+x_{2}=1 \\
& x_{1}+2 x_{2}-x_{3}=3
\end{aligned}
$$

The equations can be expressed as

$$
\left[\begin{array}{ccc}
3 & -1 & 1 \\
2 & 1 & 0 \\
1 & 2 & -1
\end{array}\right]\left[\begin{array}{l}
x_{1} \\
x_{2} \\
x_{3}
\end{array}\right]=\left[\begin{array}{l}
2 \\
1 \\
3
\end{array}\right]
$$

## Linear Equations

When $\mathbf{A}^{-1}$ is computed the equation becomes

$$
X=A^{-1} B=\left[\begin{array}{ccc}
0.5 & -0.5 & 0.5 \\
-1.0 & 2.0 & -1.0 \\
-1.5 & 3.5 & -2.5
\end{array}\right]\left[\begin{array}{l}
2 \\
1 \\
3
\end{array}\right]=\left[\begin{array}{c}
2 \\
-3 \\
7
\end{array}\right]
$$

Therefore

$$
\begin{aligned}
& x_{1}=2, \\
& x_{2}=-3, \\
& x_{3}=-7
\end{aligned}
$$

## Linear Equations

The values for the unknowns should be checked by substitution back into the initial equations

$$
\begin{aligned}
& x_{1}=2, \\
& x_{2}=-3, \\
& x_{3}=-7
\end{aligned}
$$

$$
3 x_{1}-x_{2}+x_{3}=2
$$

$$
2 x_{1}+x_{2}=1
$$

$$
x_{1}+2 x_{2}-x_{3}=3
$$

$$
\begin{aligned}
& 3 \times(2)-(-3)+(-7)=2 \\
& 2 \times(2)+(-3)=1 \\
& (2)+2 \times(-3)-(-7)=3
\end{aligned}
$$
